## PROJECT DESCRIPTION

Doosan Infracore, with over 70 years of history, is a global company that produces various sizes of excavators, loaders, and diesel engines, ranging from compact to large-size machinery. Since becoming a member of Doosan Group in 2005, the company has strived to take another giant leap forward by improving its competitiveness and securing new growth engines through global M&A activities.

Doosan Infracore has expanded its R&D investment to develop and offer products beyond customers' expectations, focusing on quality improvement through diverse function tests and reliability evaluation. The facility includes a 12-story structure with two underground levels that accommodates some 1,000 R&D personnel. In addition to office and research areas, the center will provide a "Town Hall Meeting Space" and "Idea Rooms" for fostering communication and cultivating creative ideas.
